Logistics/Announcements

- Lab this week: Lab 6
- HW8 due this week on Thursday at 6 PM
- Learning Log 8 due on Saturday at 6 PM
- HW and LL deadlines have a 48 hour grace period
- Test/Bonus Test: Bonus Test 3 available this week (Chapters 5 & 6)
- Test Window: Friday 6 PM - Sunday 6 PM

How to do well in this course

GETTING STARTED

Before the Term starts

After the first class

In the first week

Week 1 - Introductions!

PART 1 - KINEMATICS

Week 2 - Chapter 2

Week 3 - Chapter 3

Week 4 - Chapter 4

PART 2 - DYNAMICS

Videos

Below are the assigned videos for this week. The videos are collapsible so once you're done with one, you can move to the next one. In the sidebar on the right, you can use the checklists to keep track of what's done.

Required Videos

1. Introduction to Gravitational Potential Energy with Zero Line Examples

Introduction to Gravitational Potential Energy with Zero Line Examples

$PE_g = mgh$

m = mass of object

g = acceleration due to gravity

$[g_{Earth} = +9.81 \frac{m}{s^2}]$

$h = ?$

Figure 8.1 Shown here is part of a Ball Machine sculpture by George Rhoads. A ball in this contraption is lifted, rolls, falls, bounces, and collides with various objects, but throughout its travels, its kinetic energy changes in definite, predictable amounts, which depend on its position and the objects with which it interacts. (credit: modification of work by Roland Tanglao)

Chapter Outline

- ▶ 9 Linear Momentum and Collisions
- ▶ 10 Fixed-Axis Rotation
- ▶ 11 Angular Momentum
- ▶ 12 Static Equilibrium and Elasticity
- ▶ 13 Gravity

In George Rhoads' rolling ball sculpture, the principle of conservation of energy governs the changes in the ball's kinetic energy and relates them to changes and transfers for other types of energy associated with the ball's interactions. In this chapter, we introduce the important concept of potential energy. This will enable us to formulate

Wednesday's Class

**8.4 Potential Energy Diagrams and Stability
8.5 Sources of Energy**

EXAMPLE 8.1

Basic Properties of Potential Energy

A particle moves along the x -axis under the action of a force given by $F = -ax^2$, where $a = 3 \text{ N/m}^2$. (a) What is the difference in its potential energy as it moves from $x_A = 1 \text{ m}$ to $x_B = 2 \text{ m}$? (b) What is the particle's potential energy at $x = 1 \text{ m}$ with respect to a given 0.5 J of potential energy at $x = 0$?

EXAMPLE 8.1**Basic Properties of Potential Energy**

A particle moves along the x -axis under the action of a force given by $F = -ax^2$, where $a = 3 \text{ N/m}^2$. (a) What is the difference in its potential energy as it moves from $x_A = 1 \text{ m}$ to $x_B = 2 \text{ m}$? (b) What is the particle's potential energy at $x = 1 \text{ m}$ with respect to a given 0.5 J of potential energy at $x = 0$?

Solution

- a. The work done by the given force as the particle moves from coordinate x to $x + dx$ in one dimension is

$$dW = \vec{F} \cdot d\vec{r} = Fdx = -ax^2dx.$$

Substituting this expression into [Equation 8.1](#), we obtain

$$\Delta U = -W = \int_{x_1}^{x_2} ax^2dx = \frac{1}{3}(3 \text{ N/m}^2)x^3 \Big|_{1 \text{ m}}^{2 \text{ m}} = 7 \text{ J.}$$

- b. The indefinite integral for the potential energy function in part (a) is

$$U(x) = \frac{1}{3}ax^3 + \text{const.},$$

and we want the constant to be determined by

$$U(0) = 0.5 \text{ J.}$$

Thus, the potential energy with respect to zero at $x = 0$ is just

$$U(x) = \frac{1}{3}ax^3 + 0.5 \text{ J.}$$

Therefore, the potential energy at $x = 1 \text{ m}$ is

$$U(1 \text{ m}) = \frac{1}{3}(3 \text{ N/m}^2)(1 \text{ m})^3 + 0.5 \text{ J} = 1.5 \text{ J.}$$

Energy Skatepark

Energy Skatepark

Energy Types

Key Equations

Difference of potential energy

$$\Delta U_{AB} = U_B - U_A = -W_{AB}$$

Potential energy with respect to zero of potential energy at \vec{r}_0

$$\Delta U = U(\vec{r}) - U(\vec{r}_0)$$

Gravitational potential energy near Earth's surface

$$U(y) = mgy + \text{const.}$$

Potential energy for an ideal spring

$$U(x) = \frac{1}{2}kx^2 + \text{const.}$$

Work done by conservative force over a closed path

$$W_{\text{closed path}} = \int \vec{F}_{\text{cons}} \cdot d\vec{r} = 0$$

Condition for conservative force in two dimensions

$$\left(\frac{dF_x}{dy} \right) = \left(\frac{dF_y}{dx} \right)$$

Conservative force is the negative derivative of potential energy

$$F_l = -\frac{dU}{dl}$$

Conservation of energy with no non-conservative forces

$$0 = W_{nc,AB} = \Delta(K + U)_{AB} = \Delta E_{AB}.$$

Clicker Questions

CQ.8.1

Which activity requires a person to exert force on an object that causes the object to move but does not change the kinetic or potential energy of the object?

- a) moving an object to a greater height with acceleration
- b) moving an object to a greater height without acceleration
- c) carrying an object with acceleration at the same height
- d) carrying an object without acceleration at the same height

A

B

C

D

B

C

D

E

CQ.8.3

How much work is done by gravity when a 7.64 kg boulder falls to the ground from the top of a 33.4 m tall cliff?

- a) 0.0 J, because gravity doesn't do work
- b) 2.24 J
- c) 26.0 J
- d) 2500 J

Activity: Worked Problems

64 . A block of mass 500 g is attached to a spring of spring constant 80 N/m (see the following figure). The other end of the spring is attached to a support while the mass rests on a rough surface with a coefficient of friction of 0.20 that is inclined at angle of 30° . The block is pushed along the surface till the spring compresses by 10 cm and is then released from rest. (a) How much potential energy was stored in the block-spring-support system when the block was just released? (b) Determine the speed of the block when it crosses the point when the spring is neither compressed nor stretched. (c) Determine the position of the block where it just comes to rest on its way up the incline.

See you next class!
